Title : Steric hindrances and properties of certain aryl amino naphthoquinones

Periodical : Zhur. ob. khim. 24/1, 181-187, Jan 1954

Abstract : The attitude of N-ethylated and N-acetylated derivatives of 2-anilino-3-halogenonaphthoquinone-1,4 was investigated when exposed to light. It was found that ethylated and acetylated products when exposed to sun light separate the ethyl or acetyl groups and convert into non-substituted products. Increased reactivity of the halide atom in position 3 was found to be another prominent characteristic of ethylated and acetylated compounds. The photochemical separation of groups in the nitrogen atom and the increased reactivity of halide atoms in ethylated and acetylated products is explained by the presence of steric hindrances in their molecules. The origin of the steric hindrances is elucidated. Six references: 4-USSR; 1-German and 1-USA (1884-1952). Table.

on the mol. structure, including the presence and nature of the H bond. The half-wave potentials of 4-hydroxyazobenzene (I) and 4-phenylazobenzene (II) were of the same order of magnitude as in the case of azobenzene (III) and, therefore, the reduction of I and II was not as difficult as that of III. The reduction of I and II was more difficult than that of III because of the lower polarization of the azo group in the range with a H bond than in the compound III. Consequently, the ring became stronger, and the reduction with the Hg drop electrode was more difficult. The substitution group in the phenol para and meta positions in I and II affected the half-wave potentials. The electron-donor OCH<sub>3</sub> group in the para position of the phenyl group impeded reduction, while the acceptor group, COOH, helped the reduction of the azo compounds on the Hg electrode.

TITLE: Double Aryl-diazonium Chlorides of Niobium<sup>1</sup> and Tantalum<sup>1</sup>

PERIODICAL: Zhurnal obshchey khimii, 1960, Vol. 30, No. 7,  
pp. 2235 - 2238

TEXT: No alkyl- and aryl-organo-metallic compounds have hitherto been obtained for niobium and tantalum as well as for most of the transition metals. The data given in Refs. 1-3 on this subject must be doubted. Organo-metallic compounds of vanadium, niobium, and tantalum which were obtained by the diazo method have hitherto not been described. The aim of the present paper was to synthesize double aryl-diazonium salts with niobium and tantalum pentachlorides. To explain the effect of nucleophilic and electrophilic substituents on double diazonium salts, diazonium chlorides with various aryls were used for the reaction with niobium pentachloride. According to data (Refs. 5,6) published on the strong tendency of  $\text{NbCl}_5$  toward hydrolysis under the formation of  $\text{NbOCl}_3$ ,

Card 1/3

Double Aryl-diazonium Chlorides of Niobium  
and Tantalum

double diazonium salts of niobium oxychloride resulted instead of the expected double diazonium salts of niobium pentachloride. The o- and p-anisyl-diazonium salts and  $\text{NbCl}_5$  were taken at a molar ratio of 2 : 1.

Thus, the stable double salts  $(\text{CH}_3\text{OC}_6\text{H}_4\text{N}_2\text{Cl})_2 \cdot \text{NbOCl}_3$  with the coordina-

tion formula  $[\text{CH}_3\text{OC}_6\text{H}_4\text{N}_2]^+ \begin{bmatrix} \text{O} & \text{Cl} \\ \text{ClNbCl} \\ \text{Cl} & \text{Cl} \end{bmatrix}^{2-}$ , and with the coordination number

of niobium were obtained. The double salt of phenyl-diazonium chloride with niobium oxychloride  $(\text{C}_6\text{H}_5\text{N}_2\text{Cl})_3 \cdot \text{NbOCl}_3$  was obtained at a ratio of 2 : 1 of the initial products. The ratios 3 : 1 and 1 : 1 yielded salts of unstable composition. For the salt  $(\text{C}_6\text{H}_5\text{N}_2\text{Cl})_3 \cdot \text{NbOCl}_3$  two coordination formulas were suggested. Substitution of hydrogen by the nucleophilic group  $\text{CH}_3\text{O}$  in phenyl increases the stability of double diazonium salts with  $\text{NbOCl}_3$  whereas on the introduction of the electrophilic group  $\text{NO}_2$  no double salt is formed at all. Under equal conditions, no

SOV/72-59-7-14/19

AUTHOR: Vladimirtsev, K. S.

TITLE: Mechanization and Organization of Work in the Painting Department (Mekhanizatsiya i organizatsiya raboty v zhivopisnom tsekhe)

PERIODICAL: Steklo i keramika, 1959, Nr 7, pp 43 - 47 (USSR)

ABSTRACT: The percentage number of workers occupied in the Dulevo Works with the decorating of products by means of various methods may be seen from the table. The problems of adaption to assembly line production and the mechanization of all work in the painting department are solved by different ways. A cradle assembly line of a length of 445 m transports the products to the working places and to the furnace. 6 persons each work at the 4 assembly lines according to the method of transfer in which the color samples are transferred from the paper to the products (see Fig 1) and then introduced into a drying chamber above the assembly line. The paper is then taken off, the necessary improvements are made, and the products are transported to the furnace by means of a cradle assembly line. By this method the output could be increased by 20 to 25%. In the department 2 assembly lines which are operated by 14 persons,

Card 1/2

Mechanization and Organization of Work in the  
Painting Department

SOV/72-59-7-14/19

and which supply approximately 4000 plates of a diameter of 240 mm in one layer, work according to the method of transfer by printing. Figure 2 shows a semi-automatic aerograph (PA-1) which applies the color pattern by means of a sprayer and a pattern. Its design and its mode of operation are described in detail. The output per layer is 3600 pieces, the working cycle is 8 sec and its weight is 195 kg. The burning of the ornamented products is performed in 4 muffle furnaces and in one without muffles. The latter was constructed recently according to a design by the GIKI (see Fig 3). The burning is carried out in cases at temperatures of from 950 to 980°. The furnace without muffles may be easily fitted into an assembly line. After the introduction of the new assembly lines and the mechanization of the working processes an increase in the output of the painting department by 20 to 25% is expected. There are 3 figures and 1 table.

Orig Pub: Sb. nauchn. tr. Dagest. Med. in-t, 1956, 6, 112-113.

Abstract: Three cases of a complementary sympathetic trunk (ST) in female embryos, 6-7 months old, are described. In the first case, the trunk, 15 mm. long, proceeded along the anterior surface of the spinal column from the 4th intercostal space to the 8th rib. It consisted of six ganglia, connected by internodal branches. From the right ST, eight branches approached it, and from it sixteen branches proceeded to the anterior surface

TITLE: Deep-water circulation in the Mediterranean basins of the world ocean

SOURCE: Okeanologiya, v. 6, no. 4, 1966, 569-579

TOPIC TAGS: oceanography, deep water circulation, ~~strait~~, ~~precipitation~~, ~~climate~~,  
ocean current

ABSTRACT: There are several areas in the World Ocean isolated from the open ocean. It is suggested that such areas should be called "Mediterranean basins." Five such basins have been distinguished. So far, no review has been published on oceanography of the Mediterranean basins. The present paper presents, for the first time, a brief review on the study of deep-water circulation in the Mediterranean basins, dealing in only with the general structure and dynamics of deep-water masses. Detailed treatment of deep-water mixing and water renewal problems as well as those of water exchange in straits is intended to be published in subsequent communications. Some recent publications devoted to deep-water structure and circulation are also reviewed.

TITLE: A photoelectric installation for studies of the Moon and planets

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 12, 1962, 16,  
abstract 12A165 ("Byul. Astron. observ. im. V. P. Engel'gardta",  
1961, no. 36, 61 - 66)

TEXT: The installation consists of an electrophotometer, a photoelectric  
spectrophotometer and a spectropolarimeter. Parts can be easily interchanged  
when one type of observations is replaced by another. Usually a slit spectro-  
graph is screwed to the telescope ocular end. A photohead which contains a pho-  
tomultiplier, a projecting and a guidance system can be inserted in front of the  
spectrograph slit. A d.c. amplifier is designed according to V. I. Moroz's pro-  
posal with insignificant modifications. ЭПП-09 (EPP-09) serves as a recording  
device. At a favorable weather it is possible to observe the Moon, planets and  
stars down to 7 - 8<sup>m</sup>. The spectrograph has glass optics, one prism and dispersion

of 80 A/mm at H $\gamma$ . It is possible to imprint comparison spectrum calibrating and standardization scales. The second slit of the spectrograph can be displaced uniformly along dispersion. In order to reduce the effects of atmospheric transparency changes, scintillations and other interferences, a deducting system is employed, with division of the light beam and two photomultipliers. A special arrangement of resistors in supply divisors of photomultipliers is used to reduce the signal-to-noise ratio. Signals from the  $\Phi 3Y(PEU)$  are fed to logarithmic amplifiers, and from the latter to the deducting device whose output is recorded on a d.c. oscillograph with a plane screen. The screen is photographed. In place of the head of the electrophotometer, a polaroid with its rotational system can be mounted in front of the spectrograph slit. Monochromatic bundle passing through the spectrograph second slit turns out to be modulated in case of polarized light. A signal from the photomultiplier of the spectrophotometer is fed to the vertical plates of the oscillograph, while horizontal sweep is synchronized with rotation of the polaroid. There is a device for determination of position angles on oscillograms. Instrumental polarization is taken into account by means of the deducting device. The polarimeter measures reliably monochromatic (4 - 8 A) polarization of about 1%, the accuracy of determining

TITLE: Some Features of the Fluorescence of Aromatic Amino Acids  
( Nekotoryye osobennosti fluorestsentsii aromaticheskikh  
aminokislot).

PERIODICAL: Doklady AN SSSR, 1957, Vol. 116, Nr 5 pp. 780-783 (USSR)

ABSTRACT: The present work investigates the possibilities of the energy transfer of a quantum from different donors to aromatic amino acids which emit this energy in form of luminescence. The measurings are shortly described. The curves of the concentration extinction have the same form with various wave lengths of exciting light. This speaks in favor of the fact that the extinction could be caused by the migration of energy between the molecules. A table contains the relative intensities of the fluorescence of powders and solutions of amino acids. The quantum yield of the fluorescence of troptophane as well as of phenylalanine in dry state was constant for some wave lengths within the range of own absorption. Crystalline alanine and lysine were neither fluorescent in dry state nor in solution. The screening effect of phenylalanine observed is a little smaller than

Card 1/3

Some Features of the Fluorescence of Aromatic Amino Acids.

20-5-17/48

the theoretically observed screening and is least clear in highest concentrated solutions. This fluorescence sensibitized with phenylalanine can be observed much clearer in mixed crystals of these substances. The production of these mixed crystals is shortly described. The author determined the spectra of excitation of the fluorescence of these substances using two light filters. The results are shown in a diagram as well as in a table. The spectral composition of the luminescence of deposits is the same with excitation by light of various wave lengths. This spectral composition is similar to the emission spectrum of triptophane and differs clearly from the fluorescence of phenylalanine. The relative intensity of the fluorescence of the compound is greater with the excitation by band 254m $\mu$  than with excitation by band 280m $\mu$  of the same intensity. Thus the quanta absorbed in the system by phenylalanine and by triptophane are emitted in form of the fluorescence of triptophane and we obviously have to deal with a migration of energy from phenylalanine to triptophane. This migration obviously takes place according to the exciton mechanism. Furthermore the author investigates the excitation spectra of fluorescence with living yeast by means of the measurements of the

Card 2/3

Some Features of the Fluorescence of Aromatic Amino Acids. 20-5-17/48

albumin luminescence. The experimental material collected hitherto makes possible at any time the statement that within an albumin molecule a migration of energy according to the mechanism of inductive resonance is possible. There are 4 figures, 2 tables, and 11 references, 6 of which are Slavic.

Neyrokibernetika (Neurocybernetics) Moscow, Medgiz, 1962. 170 p.  
10,000 copies printed.

Ed.: K. M. Kullanda; Tech. Ed.: N. A. Bul'dyayev

PURPOSE: This book is intended for research scientists concerned with the application of cybernetics to the study of the functions of the nervous system and the brain.

COVERAGE: The book deals with the application of the methods of cybernetics to the scientific analysis of complex processes of control, processing, and transmission of information. These elements represent the basic forms of activity of the nervous system and the brain and control the function of internal organs. The book treats the representation of nerve networks, self-programming systems, complex systems of conditional reflexes, mechanisms of complex behavior based

# Neurocybernetics

SOV/6047

on processing stored information, classification of ideas and development of concepts by robots, and the application of neurocybernetics in physiology and medicine. The possibility of using cybernetics in surgery, in particular, is pointed out. Chs. I, II, and VI are general in character and should be of interest to physicists, biochemists, pathologists, and physicians in research. Chs. II, III, IV, and V should be of interest to specialists in engineering, cybernetics and theoretical cybernetics and to physiologists using the methods of cybernetics. Chs. III and IV will also be of interest to research workers concerned with neurocybernetic experiments on the brain. The authors thank A. I. Berg, Academician, Director of the Institut khirurgii (Institute of Surgery); A. A. Vishnevskiy, Professor, Member, Academy of Medical Sciences USSR; E. Ya. Kol'man, Academician; V. S. Avtomaticheskaya svarka tonkolistovoy vysokoprochnoy stali (Automatic Welding of High-Strength Sheet Steel) Moscow, Mashgiz, 1961. 38 p. 8500 copies printed.

Resp. Ed.: L. A. Malanicheva, Engineer; Tech. Ed.: N. A. Dugina.

PURPOSE: This booklet is intended for engineers, technicians, and skilled weldors engaged in welding alloy steel sheets.

COVERAGE: Experience gained by industry in the automatic welding of 30KhGSA and 25KhSNVFA alloy steel sheets is described. Information is given on the technology, equipment, and accessories used in the welding of these steels. The welding of tubes and tanks with 1 to 2 mm-thick walls made from 1Kh18N9G steel and used in aggressive media under pressures up to 200 atm. is also described. No personalities are mentioned. There are 6 references, all Soviet.

TITLE: Choice of basis for setting out of bridges

SOURCE: Geodetski list, no. 1-3, 1966, 3-9

TOPIC TAGS: general construction, triangulation ✓

ABSTRACT: During the construction of bridges, the positions of the supports within the river bed must be fixed by microtriangulation methods. The trigonometric side from whose end points one sets out the bridge one calls the base for setting. The base may be in general perpendicular or parallel to the direction of the axis of the bridge. The author discusses in considerable details the errors related to the utilization of the two types of bases and concludes from appropriate error diagrams that it is more convenient to use the basis parallel to the longitudinal axis of the bridge. Bases perpendicular to the bridge axis must be very long if the limits of errors are to be maintained within reasonable limits. Orig. art. has: 7 figures and 4 tables. [JPRS: 36,844]

PERIODICAL: V sb.: Eksperim. izuch. mechan. usiliy v gidrogeneratorakh.  
M.-L., Gosenergoizdat, 1957, pp 91-102

ABSTRACT: Disturbing alternating forces of mechanical or hydraulic origin appearing during hydroturbine operation under various conditions are analyzed. The mechanical forces caused by an unbalanced rotor or by eccentricity of the hydro unit and the periodic component of hydraulic torque due to both the nonuniformity of the velocity field before the rotor and the vortices are considered, as well as forces due to cavitation. A summary table of disturbing forces of various origins is presented for various turbine types; characteristic frequencies are indicated. Load drop conditions and measures tending to reduce hydraulic impact are considered in detail. Bibliography: 6 items.

The Geophysical Institute has developed equipment for transforming mechanical vibrations into electric impulses for direct recording by a special narrow-gate electronic circuit. The principle of the device is based on the use of a piezoelectric material.

The device is designed for recording of mechanical vibrations of various frequencies. It is capable of recording vibrations of frequencies from 1 to 100 Hz. The device is used for recording of vibrations of various objects, such as buildings, bridges, and ships.

Abstract : By the method of injection of contrast masses with subsequent preparation and reontgenography of fetuses, variants of the topography of the axillary artery (AA) were studied in relation to the nerves of the brachial plexus and to the form of the trunk of the AA. Variations were observed in the origin of the branch stems of AA and the sources of nourishment of several muscles of the upper terminal end of the brachial zone. The sites of the entrance of vessels are noted in the separate muscles and the character of the ramification of the vessels in several of them.
